# New Quantitative Volcanic Cloud and Fog Products for GOES-R

**Mike Pavolonis  
(NOAA/NESDIS)**

**Corey Calvert and Justin Sieglaff  
(UW-CIMSS)**

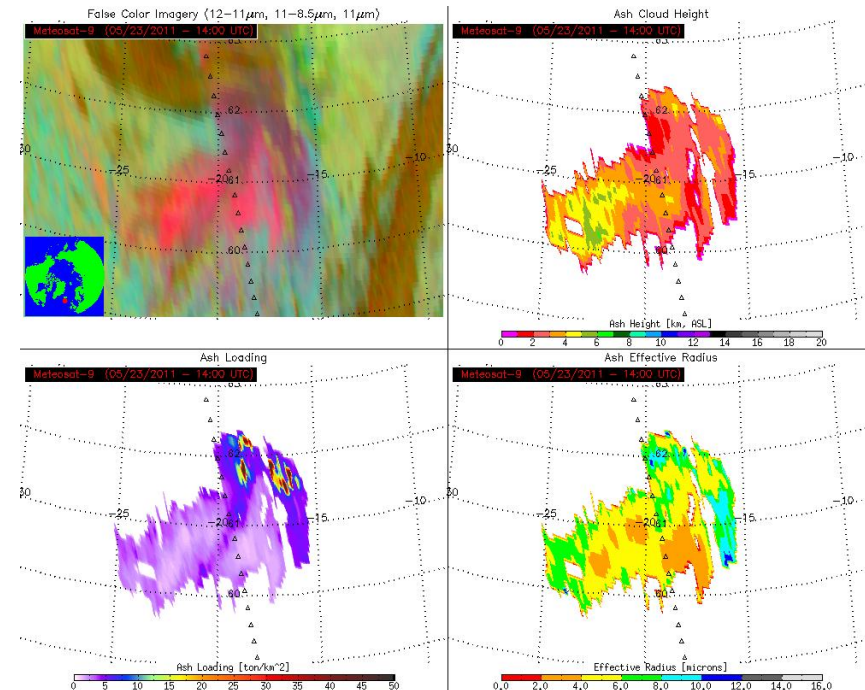

# GOES-R Volcanic Cloud Products

# GOES-R Volcanic Cloud Products

- Infrared radiances are used to retrieve ash cloud height, mass loading, and effective particle radius (ash cloud height and mass loading are required GOES-R products)
- The ash cloud property products are primarily validated using lidar and are well within the accuracy specification
- An automated volcanic cloud alert system and an  $\text{SO}_2$  product are also being developed for GOES-R

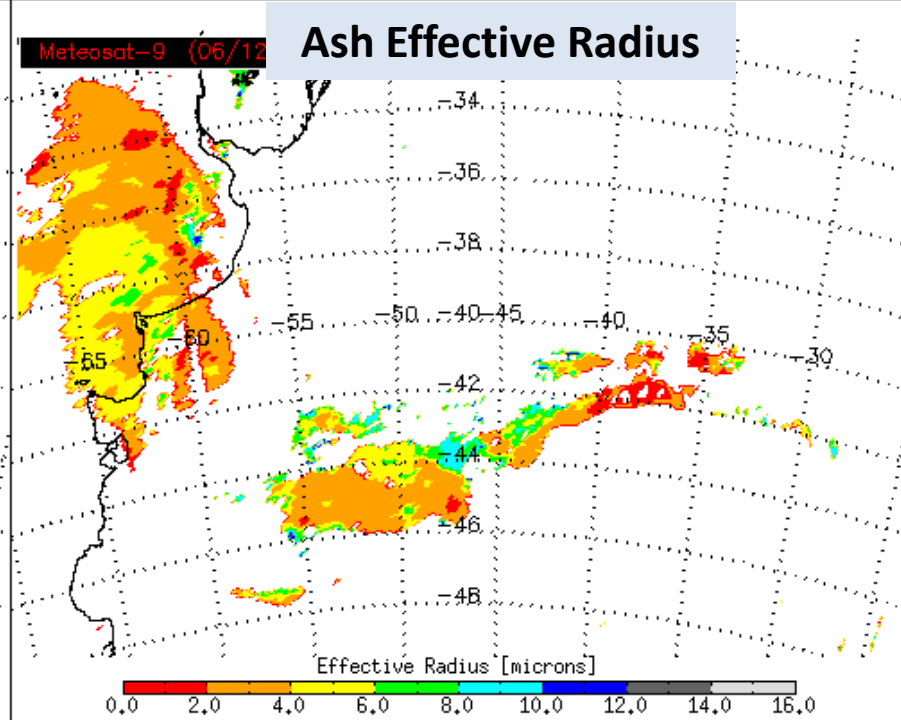

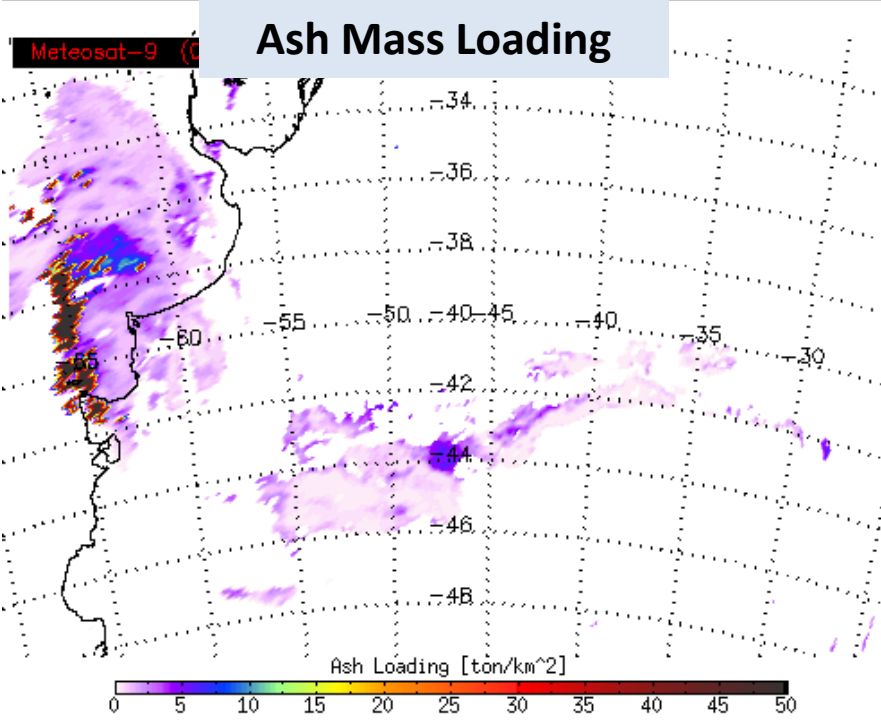

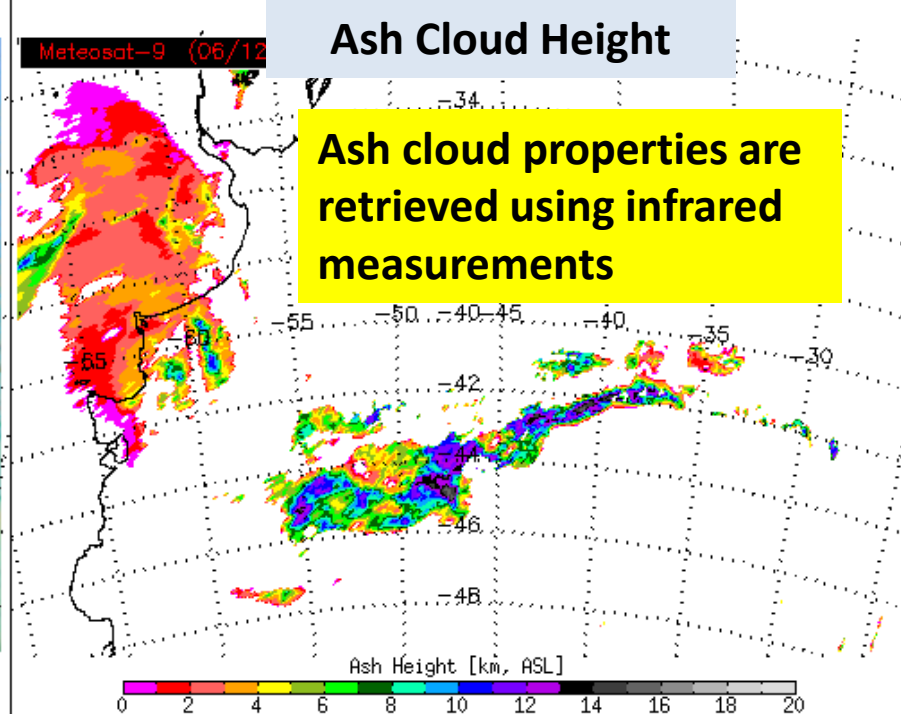

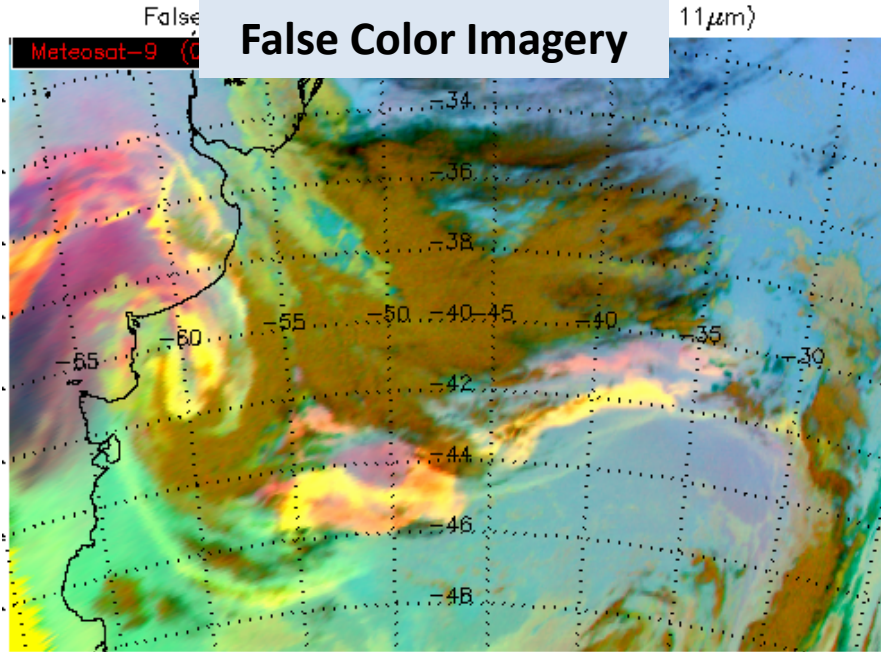

# Eastern Africa - June 12, 2011 (20:30 – 23:45 UTC)

False Color Imagery (12–11  $\mu\text{m}$ , 11–8.5  $\mu\text{m}$ , 11  $\mu\text{m}$ )

Met-9 (06/12/2011 – 20:30 UTC)

**Nabro Erupts  
for the first  
time in  
observed  
history!**

***Nabro cloud cooled at a much faster rate (50 K in 15 min) than background convection, making it detectable***

## Background Convection

13/0300Z

300  
150

13/0900Z

*First volcanic ash advisory was issued at 0400 UTC (7.5 hours after start of eruption)*

VOLCANIC ASH ADVISORY

DTG: 20110613/0400Z

VAAC: TOULOUSE

VOLCANO: DUBBI 0201-10

AREA: ETHIOPIA

SUMMIT ELEV: 1625M

ADVISORY NR: 2011/01

INFO SOURCE: METEOSAT IMAGERY

AVIATION COLOUR CODE: UNKNOWN

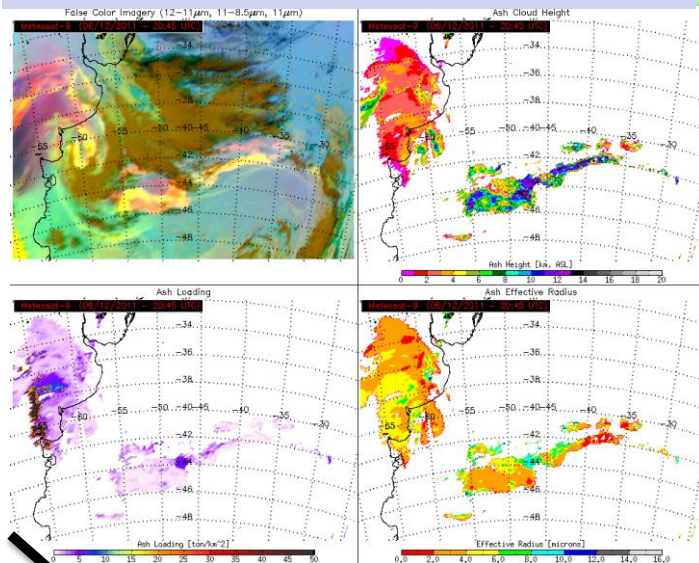

ERUPTION DETAILS: ERUPTION STARTED AROUND 23UTC

RMK: SEEMS NOW DECREASING

NXT ADVISORY: 20110613/1000Z

# Automatically Track Properties of Cordon Caulle Volcanic Ash Cloud

**Automatically Identify New  
Volcanic Eruptions and Alert  
Forecasters**

# Automated Alert Generated for Eruption of Cleveland on December 28, 2011

## Ash Probability Images

### Text Alert

From: Mike Pavlonis <mpav@ssec.wisc.edu>

Subject: **VOLCANIC CLOUD ALERT**

Date: December 29, 2011 8:34:03 AM CST

To: Mike Pavlonis <mpav@ssec.wisc.edu>, Justin Sieglaff, NOAA

@\*\*\*\*\*GENERATING VOLCANIC CLOUD WARNINGS\*\*\*\*\*

DATE: 12/29/2011

TIME: 14:04 UTC

SATELLITE: NOAA-19 AVHRR

L1B FILENAME: NSS.HRPT.NP.D11363.S1404.E1418.B1489494.GC

ORBIT NUMBER: 1489494

NUMBER OF ASH CLOUD WARNINGS: 1

NUMBER OF VOLCANIC Cb WARNINGS: 0

NUMBER OF VOLCANIC HOT SPOT WARNINGS: 0

#### VOLCANIC ASH CLOUD FOUND

Radiative Center (Lat, Lon): 52.681, -169.109

Mean Viewing Angle (degrees): 41.83

Mean Solar Zenith Angle (degrees): 135.49

Nearby Volcanoes:

Tana(47.54 km)

Kagamil(52.48 km)

Vsevidof(57.21 km)

Cleveland(58.51 km)

Uliaga(61.66 km)

False Alarm Potential: 0 out of 276994

Maximum Height: 3.5 km (11567.35 ft)

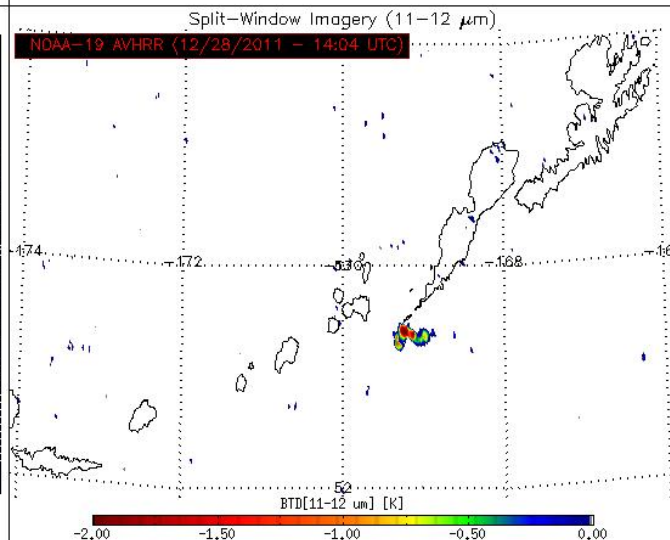

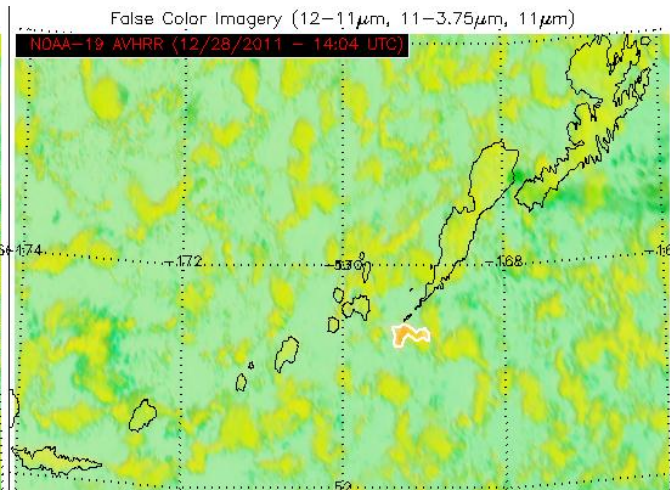

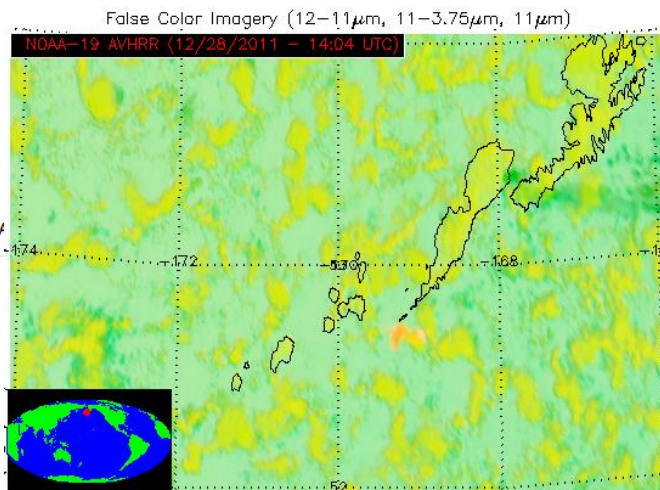

Mean Tropopause Height: 8.5 km (27831.94 ft)

Median Effective Radius: 5.06 micron

Total Mass: 0.84 ktons

Total Mass of Fine Ash: 0.00 ktons

Total Area: 173.00 km<sup>2</sup>

These alerts are currently being distributed to the USGS in Alaska and will soon be distributed to the Anchorage VAAC and Air Force Weather Agency

# GOES-R Fog/Low Cloud Products

# GOES-R Fog/Low Cloud Products

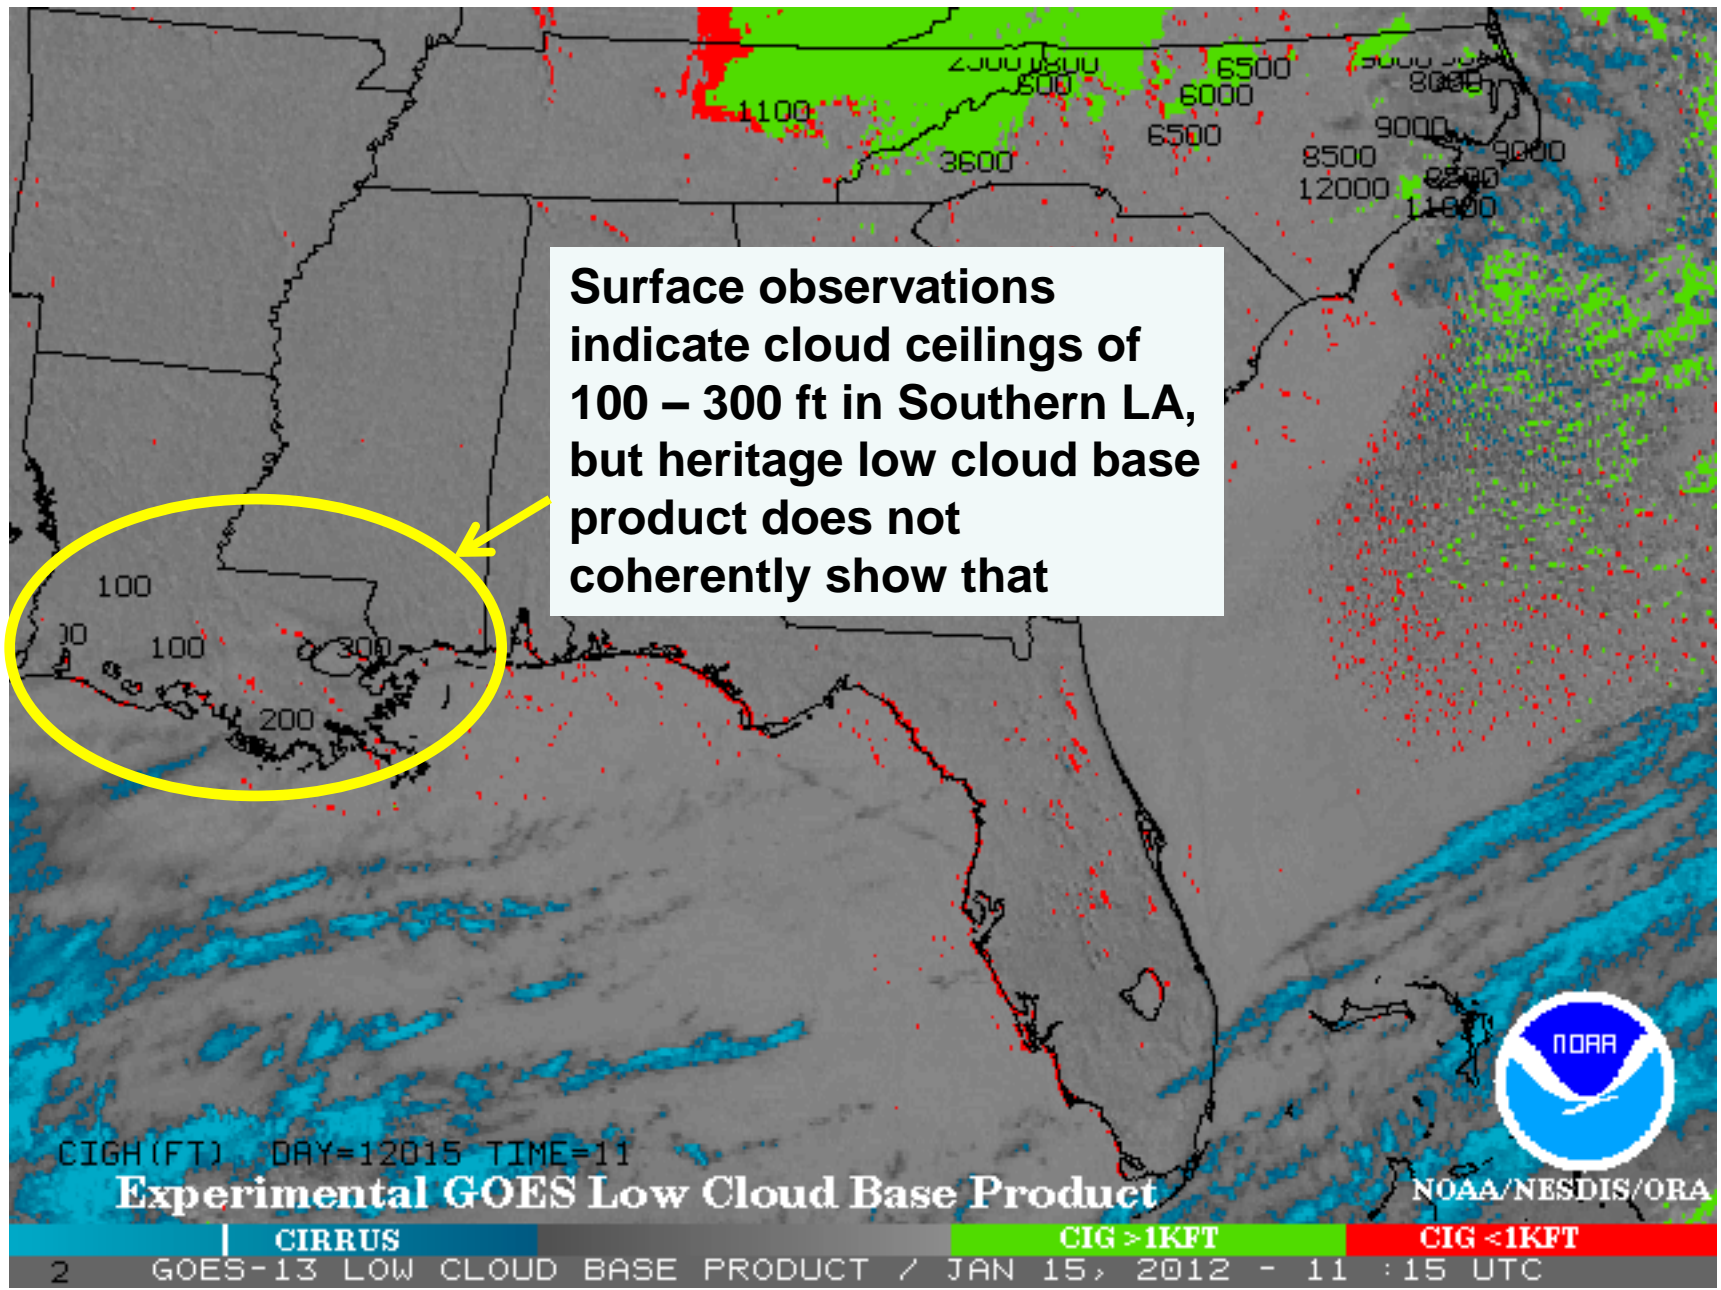

- Satellite data (from several channels) and NWP model fields from the RUC (the GFS is used outside of RUC domain) are used as predictors into a Naïve Bayes model
- Surface observations are used to train the Naïve Bayes classifier
- **Products produced:** probability of MVFR ceilings, probability of IFR ceilings, probability of LIFR ceilings, fog depth, cloud phase
- Products are currently being distributed to NWS Alaska Region, MKX WFO, and AWC via Proving Ground

- **VFR - Visual flight rules**  
ceiling > 3000 ft (914 m)
- **MVFR - Marginal visual flight rules**  
1000 ft (305 m) < ceiling < 3000 ft (914 m)
- **IFR - Instrument flight rules**  
500 ft (152 m) < ceiling < 1000 ft (305 m)
- **LIFR - Low instrument flight rules**  
ceiling < 500 ft (152 m)

# Southern LA - (January 15, 2012, 11:15 UTC)

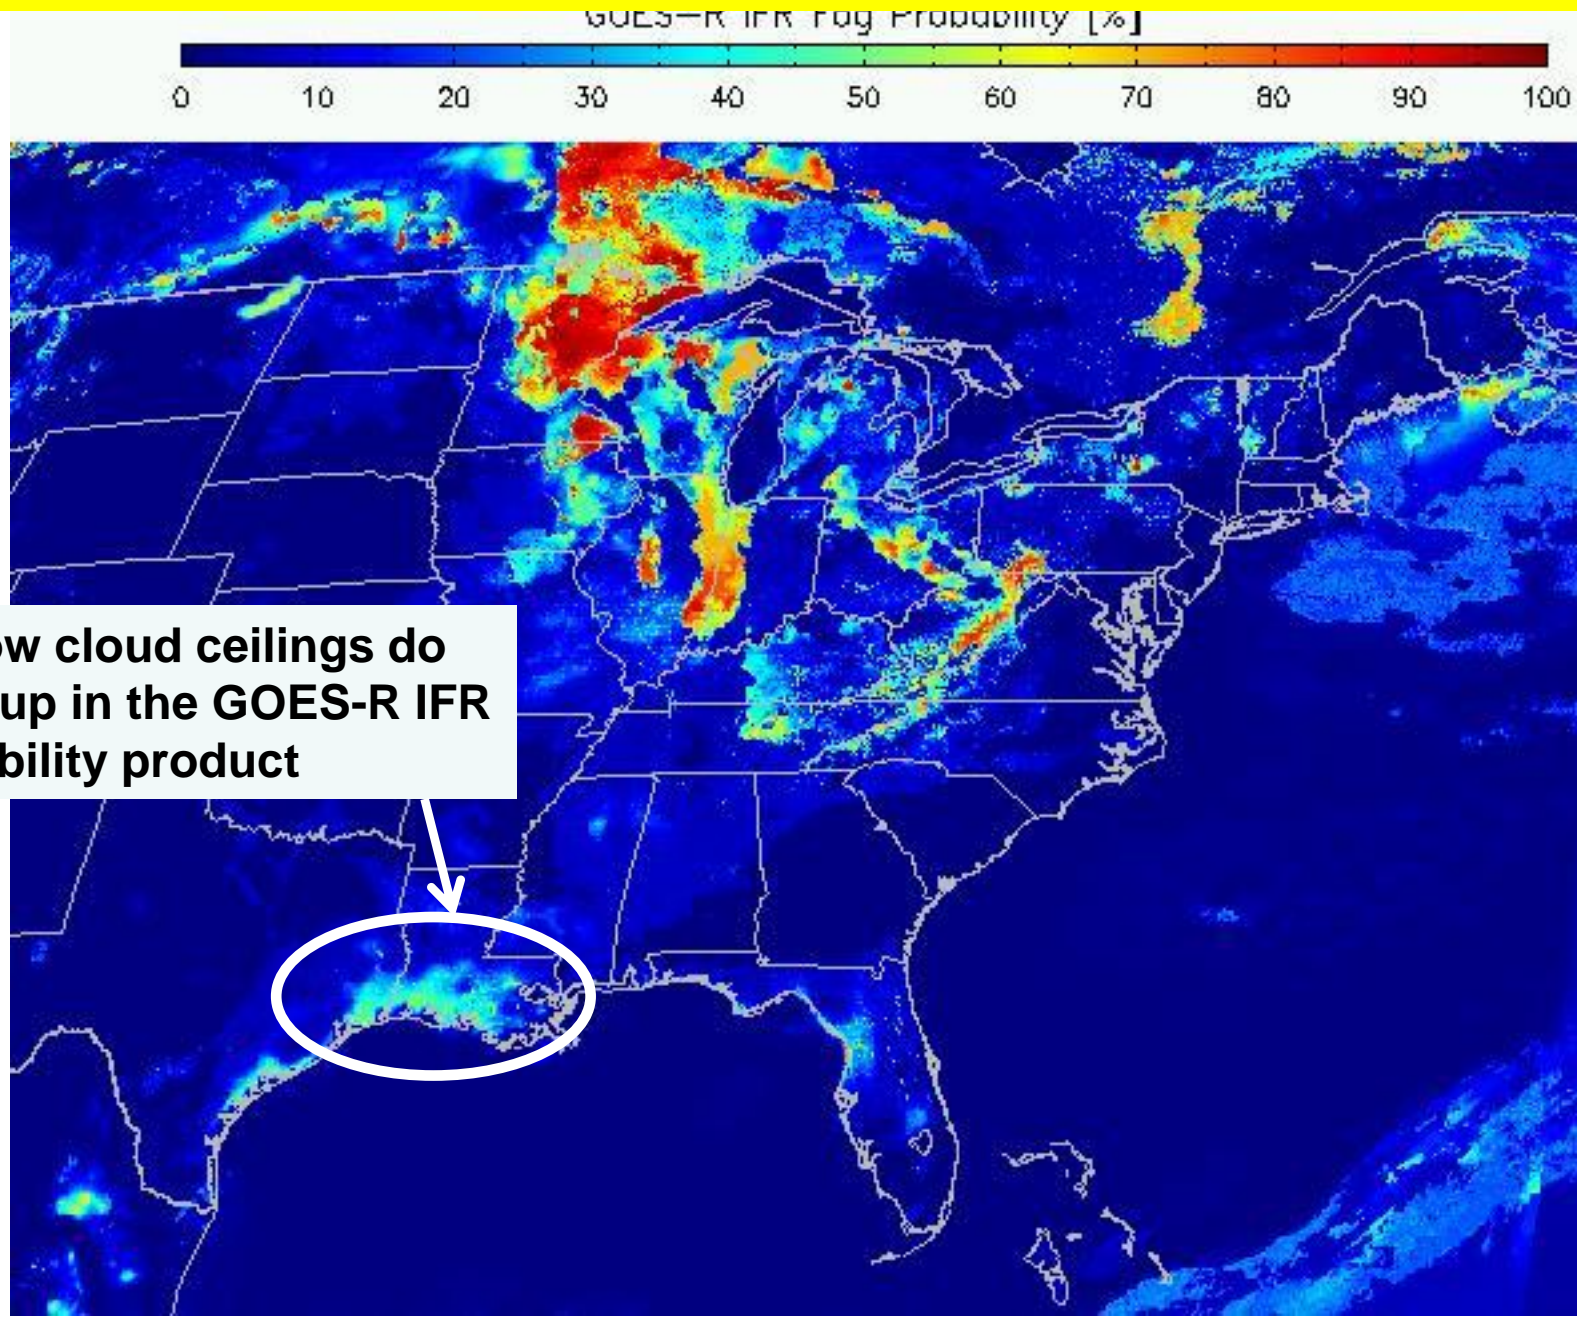

# Southern LA - (January 15, 2012, 11:15 UTC)

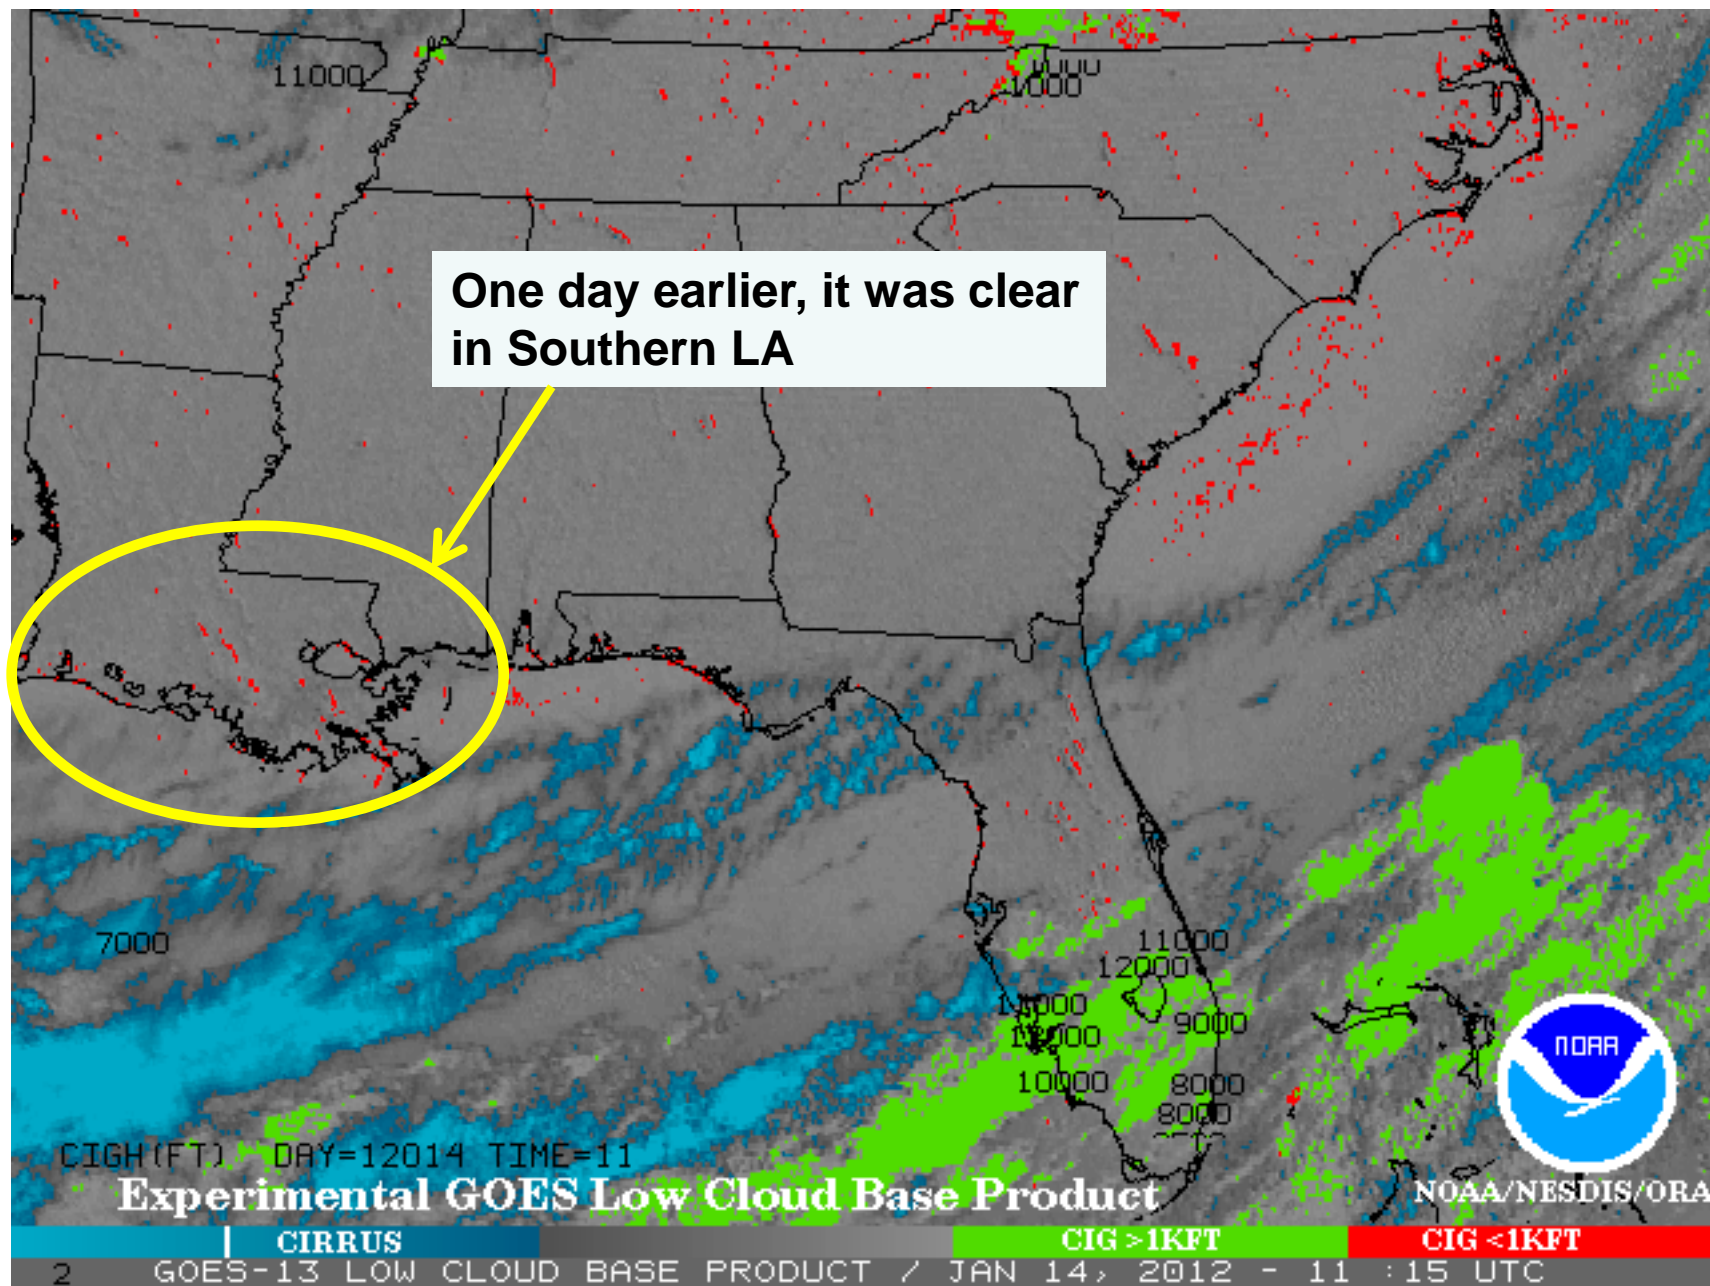

# Southern LA - (January 15, 2012, 11:15 UTC)

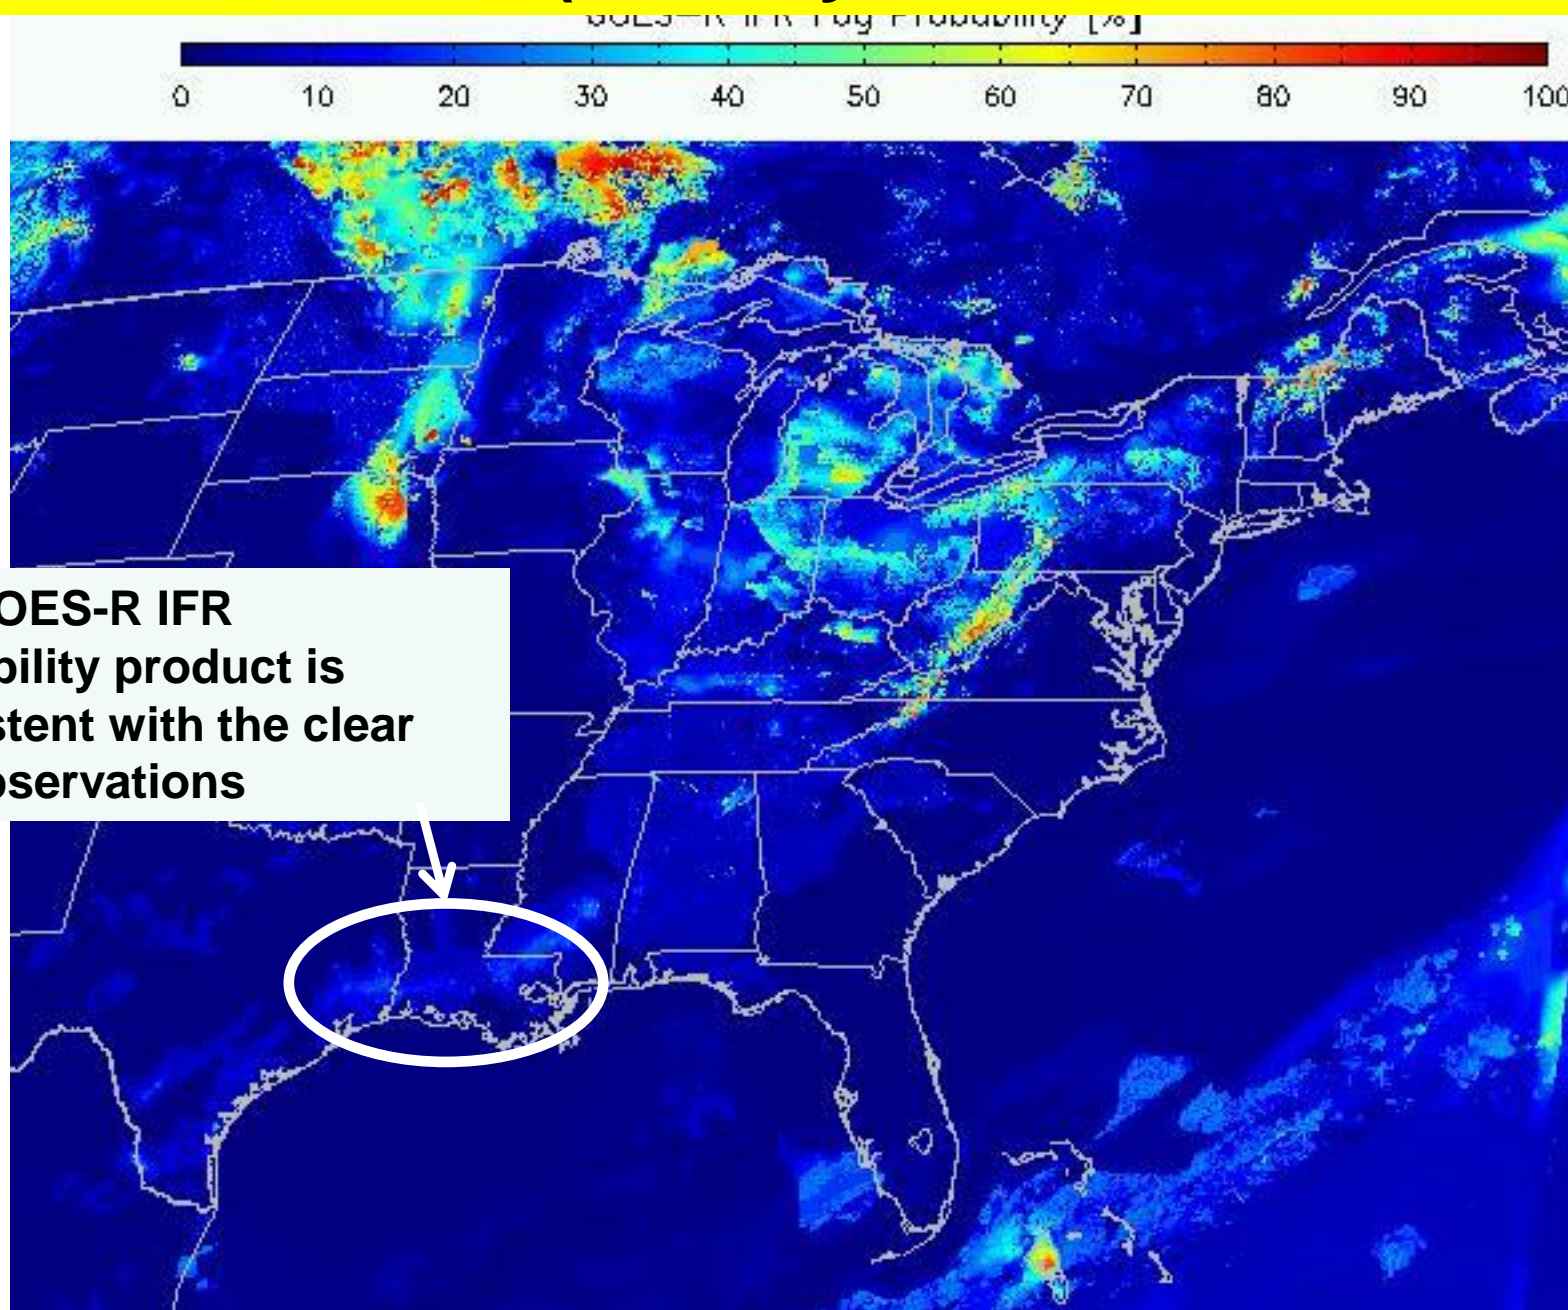

# Southern LA - (January 14, 2012, 11:15 UTC)

# Southern LA - (January 14, 2012, 11:15 UTC)

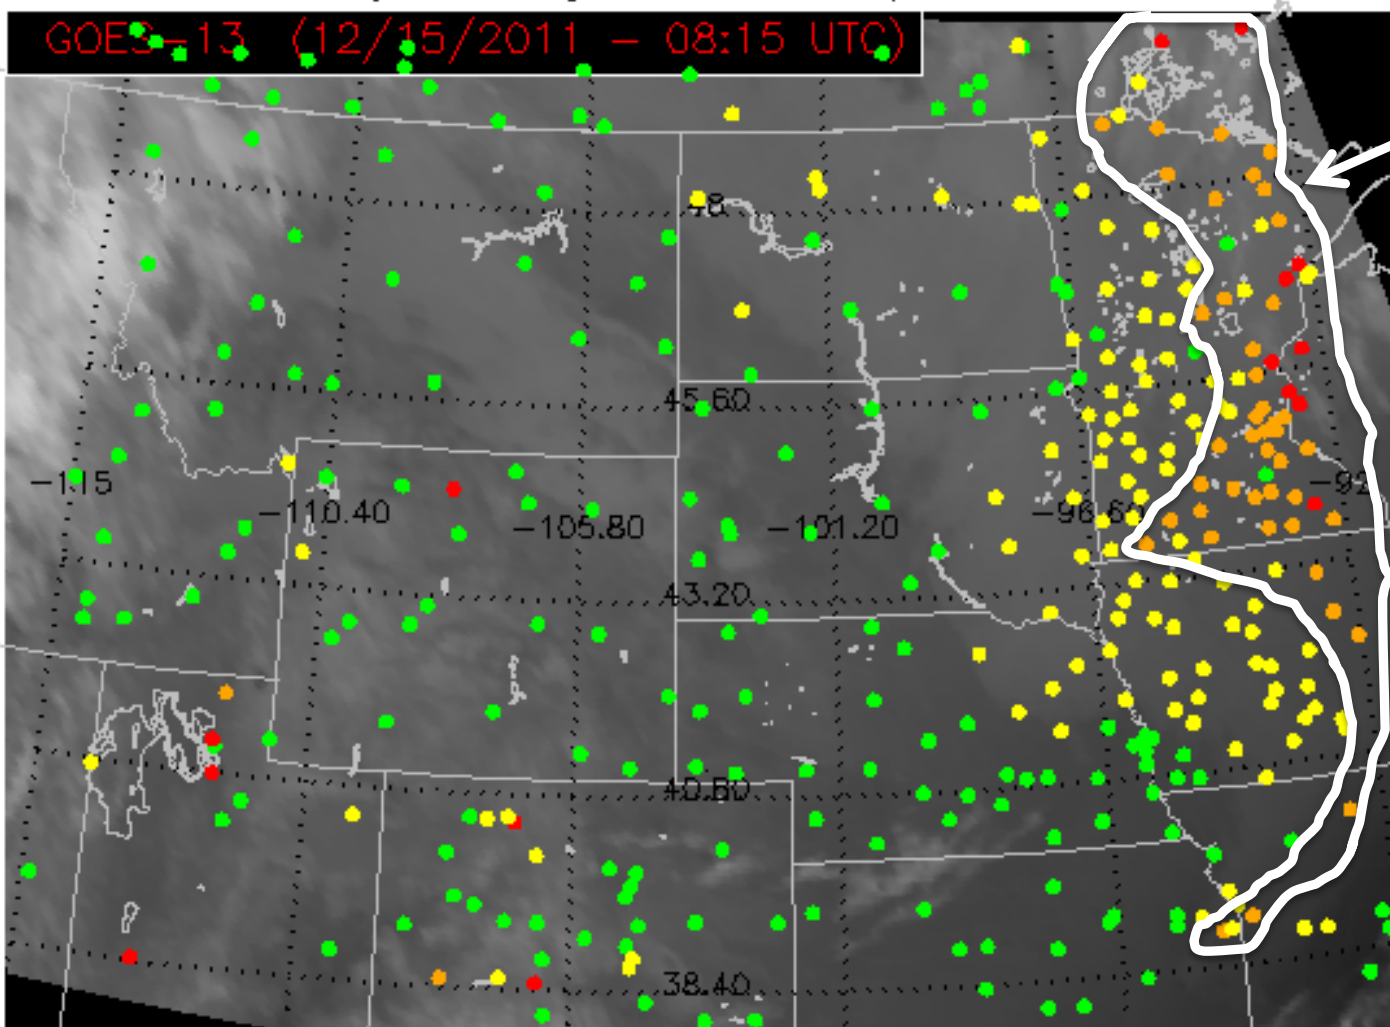

# Upper Midwest (December 15, 2011 – 08:15 UTC)

11 $\mu$ m Brightness Temperature

GOES-13 (12/15/2011 – 08:15 UTC)

Only the eastern edge of cloud deck is producing IFR or LIFR conditions

Aviation Flight Rule Category

# Upper Midwest (December 15, 2011 – 08:15 UTC)

3.9–11 micron BTD

GOES-13 (12/15/2011 – 08:15 UTC)

Traditional nighttime BTB “fog” product highlights a very large area, most of which does *NOT* have low cloud ceilings that would significantly impact aviation or ground transportation

3.9–11 micron BTB [K]

# Upper Midwest (December 15, 2011 – 08:15 UTC)

Fog Probability

GOES-13 (12/15/2011 – 08:15 UTC)

Fog Probability [%]

- The GOES-R IFR probability product highlights the hazard area with much more accuracy than traditional product
- We are experimenting with adopting a color bar commonly used to display the BTD product in order to give the GOES-R product a familiar look

# Validating the Identification of IFR Ceilings

- Comparison to surface observations of cloud ceiling indicate that the GOES-R product has a maximum skill score of 0.59 (at night) and 0.70 (during the day)
- The traditional BTD approach has a maximum skill score of only 0.28 (at night)

# Summary

- Algorithms to detect and quantitatively characterize volcanic cloud and low cloud ceiling hazards have been developed in preparation for GOES-R
- These algorithms have been shown to improve upon heritage approaches
- *Near-term plans:*
  - *Volcanic clouds:* multi-sensor volcanic cloud alert and retrieval system will continue to be developed, validated, and tested in operations
  - *Fog/low clouds:* Start using expanded domain Rapid Refresh model, update user training module, and incorporate morphometric characterization of landforms into classifier
